Data Representation in Computers

Binary System

- Computers store all data using only **0s and 1s**. These are called bits.
- 8 bits together make 1 Byte, which can store a small piece of information, like a letter or number.
- Binary numbers are like the "language" of computers. Every number, letter, image, or file is turned into a sequence of bits so the computer can understand it.

Characters (ASCII & Unicode)

- **ASCII** is a system that gives each English letter, number, or symbol a unique binary code.
- Unicode is bigger and can represent letters from all languages in the world.
- Example: The letter A = 01000001 in ASCII.
- Computers store every character as a number in binary. That's how texts in documents, emails, and programs are saved digitally.

Images, Sound, and Video

- **Images:** Each tiny dot (pixel) has a color, shown as numbers for Red, Green, and Blue (RGB).
- **Sound:** Sounds are waves, but computers store them as sequences of numbers.
- **Video:** A video is many images shown quickly with sound, all stored digitally.
- Computers can show, edit, and play images, sounds, and videos because all of it is stored as 0s and 1s.
